Heads Up, Cybersecurity Changes

In today's digital landscape, cybersecurity has become a major concern for organizations of all sizes. The implementation of a robust cyber protocol is essential to protect sensitive data, maintain customer trust, and ensure business continuity. According to the National Institute of Standards and Technology (NIST), organizations face increasing cyber threats that require comprehensive security frameworks to address vulnerabilities across layers of infrastructure (NIST, 2024). Implementation of the protocol must be followed by full-time employees, part-time employees, managers, remote workers, and any staff members who access organizational accounts or sensitive company information.

Section 1: Explanation of the New Cybersecurity Protocol

The new cyber protocol consists of several key components, including multifactor authentication (MFA), regular security audits, and employee training. These components work together to create a comprehensive security framework that addresses threats and vulnerabilities.

Multifactor Authentication (MFA) enhances security by requiring two or more verification factors to gain access to systems: something they know (password), something they have (security token), or something they are (biometrics). This can help ensure that our systems are considerably less likely to get broken into by relying on basic passwords that are susceptible to brute force attacks (Ubagaram & Pushpakumar, 2021).

Regular Security Audits involve a thorough evaluation of our organization's information systems to find vulnerabilities. This enables regulatory compliance and enhances our profitability. Audits will be conducted quarterly by our IT security team and will include penetration tests, vulnerability assessment, and review of access controls in order to maintain our compliance with the new cyber protocol.

Employee Training programs will be conducted internally. Security awareness training is essential because employees are the first line of defense against cyber threats, and human error remains one of the most significant security vulnerabilities organizations face (SANS Institute, 2024). Our training program includes modules that ensure that you have the knowledge to fortify yourself against cyber threats.

Section 2: Benefits of the New Cybersecurity Protocol

Implementing the new cyber protocol will deliver significant benefits to employees and the organization. It will enhance our security posture by reducing the risk of data breaches, which cost companies an average of millions of dollars in recovery expenses and lost business. The protocol will improve employee productivity by preventing operational disruptions that could impact cash flow and business continuity. For example, a ransomware attack can shut down critical systems for days or weeks, preventing employees from accessing the tools they need to serve customers and complete their work.

Additionally, the protocol will foster a culture of security awareness among employees, empowering each team member to recognize and respond to potential threats like phishing emails or suspicious login attempts. This shared responsibility strengthens our overall defense. Finally, implementation will enhance customer trust by demonstrating our commitment to protecting their sensitive information, which in turn protects our company's reputation and competitive position in the market.

Section 3: Identification and Definition of the Employee Group

This cyber protocol is applicable to all employees and is mandatory for anyone that uses company systems, email, cloud applications, or internal digital tools. Employees are often the first line of defense against cyberattacks, especially phishing, password theft, and unauthorized access. Since MFA adds an extra layer of protection beyond a password, all employees need to understand what it is, why it matters, and how to use it correctly.

I want to thank you, employees, for committing to bolstering the cybersecurity posture of our organization. Let's collectively work together to build a bright cyber-focused future, and these initiatives are how we get there. Let's improve business continuity, improve cash flow, and ensure digital safety for all of us.

Section 4: How Audience Influenced Word Choice and Tone

Because this blog post is written for all employees--including those without technical backgrounds--I made deliberate choices in word choice and tone to ensure accessibility and engagement.

Word Choice: I avoided technical jargon and cybersecurity acronyms that might confuse non-technical staff. For example, instead of discussing "authentication protocols" or "attack vectors," I used plain language like "verification factors" and "brute force attacks" with brief explanations. When technical terms like MFA were necessary, I defined them immediately in accessible language. I also chose inclusive language like "our organization" and "all of us" to emphasize that cybersecurity is a shared responsibility, not just an IT department concern.

Tone: I adopted an encouraging, collaborative tone rather than a directive or authoritative one. Phrases like "Let's collectively work together" and "I want to thank you, employees" were chosen to foster buy-in and partnership rather than compliance through fear or mandate. This approach recognizes that employees are more likely to embrace security practices when they feel valued and included in the process. The tone balances professionalism with approachability, acknowledging the seriousness of cybersecurity threats while remaining optimistic about our collective ability to address them.

These choices reflect an understanding that the audience includes employees at all levels of technical expertise and that successful implementation depends on their willing participation and understanding, not just policy enforcement.
